**CryoVation Self-Contained Filling System Offers Control, Profits**  
*Oxygen providers can see substantial savings by filling their own cylinders*

FORT MYERS, Fla. (May 11, 2010) – CryoVation’s portable, self-contained cylinder filling system offers medical oxygen suppliers a way to decrease costs, increase production and manage their own inventory.

The CryoVation PPS-2500 and PPS-5000 are designed for high-volume filling without the investment of a bulk tank. Oxygen gas distributors can improve their profitability and cylinder asset control by incorporating this liquid-to-gas filling system in lieu of "cascading" or having their cylinders filled by outside sources.

Oxygen suppliers say the CryoVation system has lowered their cylinder costs by 400 percent or more.

“The investment has substantially paid off for First Community,” said Ken Coombs of First Community Care, which uses the PPS-5000 in several U.S. locations. “Our cylinder costs dropped dramatically - from more than \$2.50 per cylinder to less than 50 cents per cylinder.”

The PPS-5000 system can fill at a rate of 200 E-cylinders per hour, or 5,000 square cubic feet per hour (scfh). It can be upgraded as needed by adding additional vaporizer capacity, all the way up to 15,000 scfh off of a bulk tank. The PPS-2500 provides for the filling of 100 cylinders per day at 2,500 scfh. Both systems pump from a standard liquid cylinder (45 gallon, 250 PSI or larger) to minimize product losses.
